MARKING SCHEME

LEAVING CERTIFICATE EXAMINATION 2005

MATHEMATICS – HIGHER LEVEL – PAPER 1

GENERAL GUIDELINES FOR EXAMINERS – PAPER 1

1. Penalties of three types are applied to candidates’ work as follows:
   • Blunders - mathematical errors/omissions (-3)
   • Slips - numerical errors (-1)
   • Misreadings (provided task is not oversimplified) (-1).

   Frequently occurring errors to which these penalties must be applied are listed in the scheme. They are labelled: B1, B2, B3,…, S1, S2,…, M1, M2,… etc. These lists are not exhaustive.

2. When awarding attempt marks, e.g. Att(3), note that
   • any correct, relevant step in a part of a question merits at least the attempt mark for that part
   • if deductions result in a mark which is lower than the attempt mark, then the attempt mark must be awarded
   • a mark between zero and the attempt mark is never awarded.

3. Worthless work is awarded zero marks. Some examples of such work are listed in the scheme and they are labelled as W1, W2,… etc.

4. The phrase “hit or miss” means that partial marks are not awarded – the candidate receives all of the relevant marks or none.

5. The phrase “and stops” means that no more work is shown by the candidate.

6. Special notes relating to the marking of a particular part of a question are indicated by an asterisk. These notes immediately follow the box containing the relevant solution.

7. The sample solutions for each question are not intended to be exhaustive lists – there may be other correct solutions. Any examiner unsure of the validity of the approach adopted by a particular candidate to a particular question should contact his/her advising examiner.

8. Unless otherwise indicated in the scheme, accept the best of two or more attempts – even when attempts have been cancelled.

9. The same error in the same section of a question is penalised once only.

10. Particular cases, verifications and answers derived from diagrams (unless requested) qualify for attempt marks at most.

11. A serious blunder, omission or misreading results in the attempt mark at most.

12. Do not penalise the use of a comma for a decimal point, e.g. €5.50 may be written as €5,50.

Show that \(27r^2 + 4q^3 = 0\)

Express the roots of \(3x^2 + q = 0\) in terms of \(p\).

\]

\[
2px^2 - p^2x + qx + r
\]

\[
2px^2 - 4px^2 + 2p^3
\]

\[
3p^2x + qx + r - 2p^3 = 0
\]

Remainder must = 0 since \((x - p)^2\) is a factor

\[
\Rightarrow \quad (3p^2 + q)x + (r - 2p^3) = (0)x + (0)
\]

\[
\Rightarrow \quad (i) \quad 3p^2 + q = 0 \quad \Rightarrow \quad q = -3p^2
\]

\[
(ii) \quad r - 2p^3 = 0 \quad \Rightarrow \quad r = 2p^3
\]

\[
\therefore \quad 27r^2 + 4q^3 = 27(2p^3)^2 + 4(-3p^2)^3
\]

\[
= 108p^6 - 108p^6
\]

\[
= 0
\]

or

If \((x - p)^2\) is a factor of \(f(x)\), then let \((x + a)\) be other factor.

\[
\therefore \quad (x^2 - 2px + p^2)(x + a) = x^3 + qx + r
\]

\[
x^3 + (a - 2p + a)x^2 + (p^2 - 2pa)x + p^2(a) = x^3 + (0)x^2 + (q)x + r
\]

Equating like to like

(i) \(-2p + a = 0\)  \quad (ii) \quad p^2 - 2pa = q  \quad (iii) \quad p^2a = r

(i) \quad a = 2p  \quad q = p^2 - 2p(2p) = -3p^2  \quad r = p^2(2p) = 2p^3

\[
27r^2 + 4q^3 = 27(2p^3)^2 + 4(-3p^2)^3
\]

\[
= 108p^6 - 108p^6

\(3x^2 + q = 0\)

QUESTION 2

Part (a) 10 marks  Att 3

2(a) Solve for $x$: $|x-1| < 7$, where $x \in \mathbb{R}$

Part (a) 10 marks  Att 3

2(a) $|x-1| < 7$
    $\Rightarrow -7 < x-1 < 7$
    $	herefore -7 < x-1$ and $x-1 < 7$
    $-6 < x$ and $x < 8$
    $	herefore -6 < x < 8$

or

2(a) $|x-1| < 7$
    $(x-1)^2 < 49$
    $x^2 - 2x + 1 < 49$
    $x^2 - 2x - 48 < 0$

Solve:

$x^2 - 2x - 48 = 0$
$(x+6)(x-8) = 0$
$x+6 = 0$ or $x-8 = 0$
$x = -6$ or $x = 8$

$f(x) < 0$ when $-6 < x < 8$

or

2(a) $|x-1| < 7$
    $(x-1)^2 < 49$
    $x^2 - 2x - 48 < 0$
    $(x-8)(x+6) < 0$

case I: $(x-8) > 0$ and $(x+6) < 0$
$x > 8$ and $x < -6$
not possible

case II: $(x-8) < 0$ and $(x+6) > 0$
$x < 8$ and $x > -6$

$	herefore -6 < x < 8$

Blunders (-3)

B3 expansion of $(x-1)^2$, once only.
The cubic equation $4x^3 + 10x^2 - 7x - 3 = 0$ has one integer root and two irrational roots. Express the irrational roots in simplest surd form.

2(b) The cubic equation $4x^3 + 10x^2 - 7x - 3 = 0$ has one integer root and two irrational roots. Express the irrational roots in simplest surd form.

2(b) $f(x) = 4x^3 + 10x^2 - 7x - 3$

Integral root must be $\pm 1, \pm 3$

$f(1): 4 + 10 - 7 - 3 \neq 0$

$f(-1): \neq 0$

$f(3): 108 + 90 - 21 - 3 \neq 0$

$f(-3): -108 + 90 + 21 - 3 = 0$

$\Rightarrow x = -3$ is a root $\Rightarrow (x + 3)$ is a factor

\[
\begin{align*}
x + 3) & \quad 4x^3 + 10x^2 - 7x - 3 \\
& \quad 4x^3 + 12x^2 \\
& \quad -2x^2 - 7x \\
& \quad -2x^2 - 6x \\
& \quad -x - 3 \\
& \quad -x - 3 \\
\end{align*}
\]

So, need to solve: $4x^2 - 2x - 1 = 0$

\[
x = \frac{2 \pm \sqrt{4 + 16}}{2(4)} = \frac{2 \pm \sqrt{20}}{8} = \frac{2 \pm 2\sqrt{5}}{8} = \frac{1 \pm \sqrt{5}}{4}
\]

Irrational roots: $\frac{1 + \sqrt{5}}{4}, \quad \frac{1 - \sqrt{5}}{4}$
2(b) Finds root \( x = -3 \) as above, and continues as follows:

\[
x = -3 \text{ is a root} \quad \Rightarrow (x + 3) \text{ is a factor}
\]

\[
\therefore \text{ other factor } = (4x^2 + ax - 1)
\]

\[
\therefore (x + 3)(4x^2 + ax - 1) = 4x^3 + 10x^2 - 7x - 3
\]

\[
4x^3 + 12x^2 + ax^2 - 3ax - x - 3 = 4x^3 + 10x^2 - 7x - 3
\]

\[
4x^3 + (a + 12)x^2 + (3a - 1)x - 3 = 4x^3 + 10x^2 - 7x - 3
\]

Equating coefficients:

(i) \( a + 12 = 10 \) and/or  
\[
a = -2
\]

(ii) \( (3a - 1) = -7 \)
\[
3a = -6
\]

\[
a = -2
\]

\[
f(x) = (x + 3)(4x^2 - 2x - 1) = 0
\]

\[ (2 \cos \theta)^4 = z^4 + 4 z^2 + 6 + 4 \left(\frac{1}{z}\right)^2 \]

\[ 16 \cos^4 \theta = \left(z^4 + \frac{1}{z^4}\right) + 4 \left(z^2 + \frac{1}{z^2}\right) + 6 \]

\[ 16 \cos^2 \theta = (2 \cos 4\theta) + 4 [2 \cos 2\theta] + 6 \]

\[ 16 \cos^4 \theta = 2 \cos 4\theta + 8 \cos 2\theta + 6 \]

\[ \cos^4 \theta = \frac{1}{16} [2 \cos 4\theta + 8 \cos 2\theta + 6] \]

\[ = \frac{1}{8} [\cos 4\theta + 4 \cos 2\theta + 3] \]

4(a) Write the recurring decimal 0.636363… as an infinite geometric series and hence as a fraction.

\[
\begin{align*}
\text{4(a)} & \quad 0.\overline{63} = 0.636363\ldots \\
& = 0.63 + 0.0063 + 0.000063 + \ldots \\
& = \frac{63}{100} + \frac{63}{10000} + \frac{63}{1000000} + \ldots \\
\therefore a &= \frac{63}{100} \\
r &= \frac{1}{100}
\end{align*}
\]

\[
S_\infty = \frac{a}{1-r} = \frac{\frac{63}{100}}{1 - \frac{1}{100}} = \frac{\frac{63}{100}}{\frac{99}{100}} = \frac{63}{99} = \frac{7}{11}

[i]: \(nk = -21\)

[ii]: \(\frac{n(n-1)k^2}{2} = 189\)

\[i\Rightarrow k = \frac{-21}{n}\]

\[ii\Rightarrow n(n-1)k^2 = 378\]

sub. in: \(n(n-1)\left(\frac{-21}{n}\right)^2 = 378\)

\((n^2 - n)(441) = 378n^2\)

\(441n^2 - 441n - 378n^2 = 0\)

\(63n^2 - 441n = 0\)

\(63n(n-7) = 0\)

\(\Rightarrow n = 0 \text{ or } n = 7\)

\(n = 7; \quad k = -3\)

#### 5(b)

\[
\sum_{r=1}^{n} (3r-2) = \frac{n}{2} (3n-1)
\]

Test  
\[
n = 1: u_1 = 3(1) - 2 = 1
\]
\[
\frac{n}{2} (3n-1) = \frac{1}{2} (3 - 1) = \frac{1}{2} (2) = 1
\]

\[\therefore \text{True for } n = 1 \quad P(1)\]

Assume true for \( n = k \)

\[
S_k = \frac{k}{2} (3k - 1) \quad P(k)
\]

To prove:

\[
S_{k+1} = \frac{(k + 1)}{2} \left[ 3(k + 1) - 1 \right]
\]
\[
= \frac{k + 1}{2} [3k + 2]
\]
\[
= \frac{1}{2} (k + 1)(3k + 2)
\]

Proof:

\[
S_{k+1} = S_k + U_{k+1}
\]
\[
= \frac{k}{2} (3k - 1) + \left[ 3(k + 1) - 2 \right]
\]
\[
= \frac{k}{2} (3k - 1) + (3k + 1)
\]
\[
= \frac{3k^2 - k + 6k + 2}{2}
\]
\[
= \frac{1}{2} [3k^2 + 5k + 2]
\]
\[
= \frac{1}{2} [(k + 1)(3k + 2)] \quad P(k + 1)
\]

So, \( P(k + 1) \) true whenever \( P(k) \) true. Since \( P(1) \) true, then by induction \( P(n) \) true for all positive integers \( n \) \( (n \in \mathbb{N}, n \geq 1) \).

### Part (a) 10 marks  

**7 (a)** Find from first principles the derivative of $x^2$ with respect to $x$.

#### 7(a)

$$f(x) = x^2$$

$$f(x + h) = (x + h)^2$$

$$f(x + h) - f(x) = (x^2 + 2hx + h^2) - x^2$$

$$f(x + h) - f(x) = 2hx + h^2$$

$$\frac{f(x + h) - f(x)}{h} = 2x + h$$

$$\lim_{h \to 0} \frac{f(x + h) - f(x)}{h} = 2x$$

or

#### 7(a)

$$y = x^2$$

$$y + \Delta y = (x + \Delta x)^2$$

$$\Delta y = (x + \Delta x)^2 - x^2$$

$$= x^2 + 2x\Delta x + \Delta x^2 - x^2$$

$$= 2x\Delta x + \Delta x^2$$

$$\frac{\Delta y}{\Delta x} = 2x + \Delta x$$

$$\lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} = 2x$$

B3 no limit shown or implied, or no indication $\to 0$.

B4 $x\Delta x = \Delta x^2$

**Worthless**

W1 not from 1st principles.
The parametric equations of a curve are:

\[ x = 8 + \ln^2 t \]
\[ y = \ln(2 + t^2), \text{ where } t > 0. \]

Find \( \frac{dy}{dx} \) in terms of \( t \) and calculate its value at \( t = \sqrt{2} \).

\[
\frac{dx}{dt} = 2 \left( \frac{1}{t} \right) = \frac{2}{t} \\
\frac{dy}{dt} = \frac{1}{2 + t^2} \cdot 2t = \frac{2t}{2 + t^2} \\
\frac{dy}{dx} = \left( \frac{dy}{dt} \right) \left( \frac{dt}{dx} \right) = \left( \frac{2t}{2 + t^2} \right) \left( \frac{t}{2} \right) = \frac{t^2}{2 + t^2} \\
At \ t = \sqrt{2}: \quad t^2 = 2 \quad \Rightarrow \quad \frac{dy}{dx} = \frac{t^2}{2 + t^2} = \frac{2}{2 + 2} = \frac{1}{2}

\]

\[
\frac{dy}{dx} = \frac{-y^2}{2xy + 1}
\]

At \( p(1, 2) \)

\[x = 1 \text{ and } y = 2\]

Part (c) 20 (5, 5, 5, 5) marks Att (2, 2, 2, 2)

7 (c) (i) Write down a quadratic equation whose roots are \( \pm \sqrt{k} \).

(ii) Hence use the Newton-Raphson method to show that the rule

\[u_{n+1} = \frac{(u_n)^2 + k}{2u_n}\]

can be used to find increasingly accurate approximations for \( \sqrt{k} \).

(iii) Using the above rule and taking \( \frac{3}{2} \) as the first approximation for \( \sqrt{3} \), find the third approximation, as a fraction.
Part (c) (i) 5 marks Att 2
(ii) Newton-Raphson 5 marks Att 2
Finish 5 marks Att 2
(iii) 5 marks Att 2

7(c) (i) Roots $\pm \sqrt{k}$ $\Rightarrow$ Equation: $x^2 - k = 0$.

7(c)(ii) Equation: $x^2 = k$ or $x^2 - k = 0$, so let $f(x) = x^2 - k$.
\[ f(u_n) = u_n^2 - k \]
\[ f'(u_n) = 2u_n \]

Newton-Raphson:
\[ u_{n+1} = u_n - \frac{f(u_n)}{f'(u_n)} \]
\[ = u_n - \frac{u_n^2 - k}{2u_n} \]
\[ = \frac{2u_n^2 - (u_n^2 - k)}{2u_n} \]
\[ u_{n+1} = \frac{u_n^2 + k}{2u_n} \]

Hence the given rule is the Newton-Raphson method applied to $f(x) = x^2 - k$. Thus it can be used with a suitable initial value to find increasingly accurate approximations for $\sqrt{k}$.

7(c)(iii) $u_2 = \frac{u_1^2 + k}{2u_1}$
\[ k = 3; \quad u_1 = \frac{3}{2} \]
\[ u_2 = \frac{\left(\frac{3}{2}\right)^2 + 3}{2\left(\frac{3}{2}\right)} = \frac{\frac{9}{4} + 3}{3} = \frac{21}{12} = \frac{7}{4} \]
\[ u_3 = \frac{\left(u_2\right)^2 + k}{2u_2} = \frac{\left(\frac{7}{4}\right)^2 + 3}{2\left(\frac{7}{4}\right)} = \frac{\frac{49}{16} + 3}{\frac{7}{2}} = \frac{\left(\frac{49}{16}\right)}{\frac{7}{2}} = \frac{97}{56} \]

Blunders (-3)

GENERAL GUIDELINES FOR EXAMINERS – PAPER 2

1. Penalties of three types are applied to candidates’ work as follows:
   - Blunders - mathematical errors/omissions (-3)
   - Slips - numerical errors (-1)
   - Misreadings (provided task is not oversimplified) (-1).

Frequently occurring errors to which these penalties must be applied are listed in the scheme. They are labelled: B1, B2, B3,…, S1, S2,…, M1, M2,…etc. These lists are not exhaustive.

2. When awarding attempt marks, e.g. Att(3), note that
   - any correct, relevant step in a part of a question merits at least the attempt mark for that part
   - if deductions result in a mark which is lower than the attempt mark, then the attempt mark must be awarded
   - a mark between zero and the attempt mark is never awarded.

3. Worthless work is awarded zero marks. Some examples of such work are listed in the scheme and they are labelled as W1, W2,…etc.

4. The phrase “hit or miss” means that partial marks are not awarded – the candidate receives all of the relevant marks or none.

5. The phrase “and stops” means that no more work is shown by the candidate.

6. Special notes relating to the marking of a particular part of a question are indicated by an asterisk. These notes immediately follow the box containing the relevant solution.

7. The sample solutions for each question are not intended to be exhaustive lists – there may be other correct solutions. Any examiner unsure of the validity of the approach adopted by a particular candidate to a particular question should contact his/her advising examiner.

8. Unless otherwise indicated in the scheme, accept the best of two or more attempts – even when attempts have been cancelled.

9. The same error in the same section of a question is penalised once only.

10. Particular cases, verifications and answers derived from diagrams (unless requested) qualify for attempt marks at most.

11. A serious blunder, omission or misreading results in the attempt mark at most.

12. Do not penalise the use of a comma for a decimal point, e.g. €5.50 may be written as €5,50.

Slope of tangent 5 marks Att 2

Finish 5 marks Att 2

1(b) (i)
Equation of tangent $T$: $y - y_1 = m(x-x_1)$.
Slope of normal $op = \frac{y_1 - 0}{x_1 - 0} = \frac{y_1}{x_1}$.
\(\therefore\) Slope of $T$ at point $p(x_1, y_1) = -\frac{x_1}{y_1}$.
Equation of $T$: $y - y_1 = -\frac{x_1}{y_1}(x-x_1)$ \(\Rightarrow\) $yy_1 - y_1^2 = -xx_1 + x_1^2$
$xx_1 + yy_1 = x_1^2 + y_1^2$.
But $(x_1, y_1) \in x^2 + y^2 = r^2 \Rightarrow x_1^2 + y_1^2 = r^2$.
\(\therefore\) Equation of tangent $T$: $xx_1 + yy_1 = r^2$.

or
\[ 1(b) \ (i) \quad x^2 + y^2 = r^2 \Rightarrow 2x + 2y \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{x}{y}. \]

Slope of tangent \( T \) at point \( p(x_1, y_1) \) = \( \frac{-x_1}{y_1} \).

Equation of \( T \): \( y - y_1 = \frac{-x_1}{y_1} (x - x_1) \) \( \Rightarrow yy_1 - y_1^2 = -xx_1 + x_1^2 \)

\[ xx_1 + yy_1 = x_1^2 + y_1^2. \]

But \( (x_1, y_1) \in x^2 + y^2 = r^2 \) \( \Rightarrow x_1^2 + y_1^2 = r^2. \)

But \((5, b) \in x^2 + y^2 = 169 \Rightarrow 25 + b^2 = 169. \)

\[ b^2 = 144 \Rightarrow b = \pm 12. \]

or

1 (b) (ii) Perpendicular distance from centre of circle to tangent \( 5x + by = 169 \) equals radius.

\[ \frac{|5(0) + b(0) - 169|}{\sqrt{25 + b^2}} = 13 \Rightarrow |169| = 13\sqrt{25 + b^2} \]

\[ \sqrt{25 + b^2} = 13 \Rightarrow 25 + b^2 = 169 \Rightarrow b^2 = 144. \therefore b = \pm 12. \]

Express

10 marks

2 (b) (ii)

\begin{align*}
k \vec{q} + l \perp \vec{q} & = 11 \vec{i} - 2 \vec{j}.
\end{align*}

\begin{align*}
k \left( \frac{3}{5} \vec{i} + \frac{4}{5} \vec{j} \right) + l \left( -\frac{4}{5} \vec{i} + \frac{3}{5} \vec{j} \right) & = 11 \vec{i} - 2 \vec{j}.
\end{align*}

\begin{align*}
\left( \frac{3}{5} k - \frac{4}{5} l \right) \vec{i} + \left( \frac{4}{5} k + \frac{3}{5} l \right) \vec{j} & = 11 \vec{i} - 2 \vec{j}.
\end{align*}

\begin{align*}
\therefore 3k - 4l & = 55 \quad \text{and} \quad 4k + 3l = -10.
\end{align*}

\begin{align*}
k - 12l & = 165
\end{align*}

\begin{align*}
16k + 12l & = -40
\end{align*}

\begin{align*}
25k & = 125 \quad \therefore k = 5.
\end{align*}

But $3(5) - 4l = 55 \Rightarrow l = -10$.

\[
\begin{align*}
\vec{r} &= (1-k)\left( \vec{i} + 5 \vec{j} \right) + k \left( 4 \vec{i} + 4 \vec{j} \right) = (1+3k)\vec{i} + (5-k)\vec{j}.

&= \frac{3}{\sqrt{13}}.
\end{align*}
\]

\[
\begin{align*}
4 + 12k + 20 - 4k &= \frac{3}{\sqrt{13}} \\
\sqrt{13} (24 + 8k) &= 12 \sqrt{2} \sqrt{26 - 4k + 10k^2} \\
\sqrt{13} (6 + 2k) &= 3 \sqrt{2} \sqrt{26 - 4k + 10k^2} \\
568 + 312k + 52k^2 &= 468 - 72k + 180k^2 \Rightarrow 128k^2 - 384 = 0 \\
\therefore k^2 - 3k = 0 \Rightarrow k = 3 & \text{ as } k \neq 0. \therefore k = 3.
\end{align*}

Find the equation of the line through \( p \) perpendicular to \( L_2 \).

Equation of line 15 marks Att 5

3 (a)
\[
3x - 2y + 7 = 0 \quad \Rightarrow \quad 3x - 2y = -7
\]
\[
5x + y + 3 = 0 \quad \Rightarrow \quad 10x + 2y = -6
\]
\[
13x = -13 \quad \Rightarrow \quad x = -1. \quad \therefore \quad y = 2. \quad p(-1, 2).
\]
\[
L_2 : y = -5x - 3 \quad \Rightarrow \quad \text{Slope } L_2 = -5. \quad \therefore \quad \text{perpendicular slope } = m = \frac{1}{5}.

3 (a)

Required line: \( 3x - 2y + 7 + \lambda(5x + y + 3) = 0.\)
\[
:\therefore \quad (3 + 5\lambda) + y(\lambda - 2) + (7 + 3\lambda) = 0
\]
Slope = \( \frac{3 + 5\lambda}{2 - \lambda}. \)
\[
L_2 : y = -5x - 3 \quad \Rightarrow \quad \text{Slope } L_2 = -5. \quad \therefore \quad \text{Slope of required line } = \frac{1}{5}.

### Part (c) 15 (10, 5) marks

**Part (c) (i) 10 marks**

Prove that \( f \) maps every pair of parallel lines to a pair of parallel lines.

You may assume that \( f \) maps every line to a line.

---

#### Prove 10 marks

3(c)(i)

\[
\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} 3 & -1 \\ 1 & 2 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} \Rightarrow \begin{pmatrix} x \\ y \end{pmatrix} = \frac{1}{7} \begin{pmatrix} 2 & 1 \\ -1 & 3 \end{pmatrix} \begin{pmatrix} x' \\ y' \end{pmatrix}
\]

Let \( L \) have equation: \( ax + by + c = 0 \), and \( M: ax + by + d = 0 \).

\[
\therefore \quad f(L) : \frac{a}{7} (-x' + 3y') + \frac{b}{7} (2x' + y') + c = 0 \quad \Rightarrow \quad f(L) : (-a + 2b)x' + (3a + b)y' + 7c = 0
\]

and \( f(M) : \frac{a}{7} (-x' + 3y') + \frac{b}{7} (2x' + y') + d = 0 \quad \Rightarrow \quad f(M) : (-a + 2b)x' + (3a + b)y' + 7d = 0
\]

So, \( f(L) \parallel f(M) \), since \((-a + 2b)(3a + b) = (3a + b)(-a + 2b)\), \[i.e. \quad a_1b_2 = a_2b_1\]

---

**or**

3 (c) (i)

\[ L : y = mx + c \text{ and } M : y = mx + k \text{ are two parallel lines.} \]

\[ x' = 3x - y \quad \Rightarrow \quad 2x' = 6x - 2y \]

\[ y' = x + 2y \quad \Rightarrow \quad y' = x + 2y. \quad \therefore \quad 2x' + y' = 7x \quad \Rightarrow \quad x = \frac{1}{7}(2x' + y'). \]

But \( y' = x + 2y \quad \Rightarrow \quad y' = \frac{1}{7}(2x' + y') + 2y \quad \Rightarrow \quad y = \frac{1}{7}(-x' + 3y'). \]

\[
\therefore \quad f(L) : \frac{1}{7} (-x' + 3y') = \frac{m}{7} (2x' + y') + c \quad \Rightarrow \quad f(L) : -x' + 3y' = 2mx' + my' + 7c.
\]

\[
\therefore \quad f(L) : (3-m)y' = (1+2m)x' + 7c \quad \Rightarrow \quad f(L) : y' = \left(\frac{1+2m}{3-m}\right)x' + \frac{7c}{3-m}.
\]

Similarly \( f(M) : y' = \left(\frac{1+2m}{3-m}\right)x' + \frac{7k}{3-m} \).

Both lines have same slope, \( \frac{1+2m}{3-m} \), \( \therefore \) parallel.

---

**or**

Let \( L \) and \( M \) pass through \( p \) and \( q \) respectively and both be in the direction \( \vec{m} \).

\[
\therefore \quad L = \vec{p} + t\vec{m} \quad \text{and} \quad M = \vec{q} + t\vec{m} , \quad \text{where} \ t \in \mathbb{R}
\]

\[
\therefore \quad f(L) = f(\vec{p} + t\vec{m}) = f(\vec{p}) + tf(\vec{m}) \quad \text{and} \quad f(M) = f(\vec{q} + t\vec{m}) = f(\vec{q}) + tf(\vec{m})
\]

\[
\therefore \quad f(L) \text{ and } f(M) \text{ are both lines in the direction of } f(\vec{m}) , \text{ and hence are parallel.}
\]

A cone has radius $r$ cm, vertical height $h$ cm and slant height $10\sqrt{3}$ cm.

Find the value of $h$ for which the volume is a maximum.

Volume in terms of $h$ or $r$  

Correct differentiation  

Value of $h$  

$8 \,(c) \quad h^2 + r^2 = 300 \quad \Rightarrow \quad r^2 = 300 - h^2.$

\[ V = \frac{1}{3} \pi r^2 h = \frac{1}{3} \pi h(300 - h^2) \]

\[ \therefore V = \frac{1}{3} \pi (300h - h^3) \]

\[ \frac{dV}{dh} = \frac{1}{3} \pi (300 - 3h^2) = 0 \quad \text{for maximum volume}. \]

\[ \therefore 300 - 3h^2 = 0 \quad \Rightarrow \quad h = 10, \quad \text{(since } h > 0). \]

\[ \frac{d^2V}{dx^2} = -2\pi h < 0 \quad \text{for } h = 10. \]

$$\cos \angle abc = \frac{|ab|^2 + |bc|^2 - |ac|^2}{2|ab||bc|}.$$  

$$\cos \angle a'b'c' = \frac{|a'b'|^2 + |b'c'|^2 - |a'c'|^2}{2|a'b'||b'c'|}.$$ 

But $|a'c'| = k|ac|$, $|a'b'| = k|ab|$ and $|b'c'| = k|bc|$ as $f$ is a similarity transformation. 

$$\therefore \cos \angle a'b'c' = \frac{k^2|ab|^2 + k^2|bc|^2 - k^2|ac|^2}{2k^2|ab||bc|} = \frac{|ab|^2 + |bc|^2 - |ac|^2}{2|ab||bc|} = \cos \angle abc.$$ 

$$\cos \angle abc = \cos \angle a'b'c' \Rightarrow \left| \angle abc \right| = \left| \angle a'b'c' \right|,$$
